1	Introduction	1
2	Basic concepts	5
2.1	Network basics	5
2.1.1	Network characteristics	7
2.1.2	Network models	11
2.1.3	Interrelationships between network characteristics	15
2.2	Inferring interaction networks	17
2.2.1	Estimating signal interdependencies	17
2.2.2	Deriving edges	19
3	Illustrative examples from field data analyses	21
3.1	Exemplary network analyses of brain electric and magnetic activity	22
3.1.1	Network characteristics reflect different physiological states	23
3.1.2	Network clusters might be predictive of impending seizures	25
3.1.3	Network characteristics undergo changes during seizures	30
3.2	Discussion and outline	32
4	Influence of spatial sampling	37
4.1	Exemplary field data analysis	38
4.2	Simulation studies	41
4.2.1	Measurement uncertainties and latticelike arrangement of sensors	42
4.2.2	Common sources	46
4.3	Discussion	52
5	Influence of temporal sampling	59
5.1	Simulation studies	60
5.1.1	Impact on clustering coefficient and edge density	61
5.1.2	Impact on average shortest path length	66
5.1.3	Impact on assortativity	67
5.1.4	Impact on connectedness and degree distribution	69
5.2	Field data analysis	75

5.2.1	Description of data and steps of analysis	76
5.2.2	Spectral contents of data	78
5.2.3	Clustering coefficient and average shortest path length	79
5.2.4	Assortativity	85
5.3	Discussion	86
6	Conclusion	93
7	Appendix	99
7.1	Identifying clusters in weighted networks	99
7.2	Duplication models	100
7.3	Proofs	107
	Bibliography	111
	Publications, abstracts, and talks	131
	Acknowledgments	135
