Summary	1
Zusammenfassung	2
Abbreviations	3
Figures	5
Tables	6
Introduction	7
<i>The role of insulin resistance and secretion in type 2 diabetes</i>	7
<i>Intestinal microbiota and the impact on host metabolism</i>	13
<i>Lactobacillus reuteri</i>	17
Hypothesis	20
<i>Specific aims</i>	20
Material and Methods	23
<i>Study design</i>	23
<i>Study participants</i>	24
<i>Anthropometric parameters</i>	25
<i>Intestinal permeability in vivo</i>	25
<i>Gastric emptying</i>	26
<i>Analysis of the faecal content</i>	27
<i>Oral glucose tolerance test (OGTT)</i>	29
<i>Assessment of insulin secretion and β-cell function</i>	30
<i>Isoglycemic glucose infusion test</i>	30
<i>Hyperinsulinemic-euglycemic clamp with isotopic dilution to assess insulin sensitivity</i>	32
<i>Gas chromatography-mass spectrometry to determine atom percent enrichment of [6,6²H₂] glucose</i>	33
<i>Indirect calorimetry</i>	34
<i>Biochemical analysis</i>	35
<i>Incretin concentrations</i>	36
<i>Reactive oxygen species (ROS)</i>	38
<i>Immune mediators and adipokines</i>	38
<i>Limulus test to measure LPS</i>	39
<i>¹H MRS for the determination of hepatic and muscular fat content</i>	39
<i>Lactobacillus reuteri capsules and placebo capsules</i>	40
<i>Statistical data analysis and power calculation</i>	40
Results	42
<i>Recruitment and enrollment of study subjects</i>	42
<i>Baseline characteristics of study cohort</i>	44

<i>Abundance of bacterial populations in faecal samples</i>	44
<i>Anthropometry</i>	45
<i>Ectopic lipid content</i>	47
<i>Tissue-specific whole body and hepatic insulin sensitivity</i>	47
<i>Energy expenditure and substrate oxidation</i>	48
<i>Glucose tolerance</i>	49
<i>Insulin secretion and incretin effect</i>	51
<i>Incretin secretion</i>	55
<i>Systemic Inflammation</i>	58
<i>Circulating endotoxin levels</i>	58
<i>Circulating adipokine concentrations</i>	60
<i>Concentrations of free fatty acids and triglycerides</i>	63
Discussion	64
<i>Good treatment adherence throughout the study and safety of the probiotic strain L. reuteri</i>	64
<i>Ingestion of the probiotic strain L. reuteri modulates plasma gut peptides</i>	65
<i>Administration of L. reuteri increases glucose-stimulated release of insulin and C-peptide</i>	66
<i>Ingestion of L. reuteri might accelerate intestinal motility</i>	67
<i>Administration of L. reuteri had no impact on glucagon concentrations</i>	67
<i>Effects of probiotic L. reuteri treatment on blood glucose concentrations</i>	68
<i>FFA levels seem unaffected by L. reuteri administration</i>	68
<i>L. reuteri administration does not alter systemic and hepatic insulin sensitivity</i>	69
<i>Impact of L. reuteri on fatty liver disease</i>	70
<i>Intervention resulted in preserved concentrations of systemic inflammatory markers, oxidative stress and endotoxin</i>	71
<i>Effects of L. reuteri on intestinal permeability</i>	72
<i>Effects of probiotic modulation of gut microbiota on adipokines</i>	73
<i>L. reuteri administration is associated with constant body weight and resting energy expenditure</i>	73
<i>Strengths and limitations of the study</i>	74
Conclusion	75
Outlook	76
