## Contents

1. Introduction  
   1.1 Genetics affecting pork quality................................. 2  
   1.2 Source of candidate genes for water holding capacity of pork........ 2  
   1.3 The functions of candidate genes involve the mechanism of  
         ubiquitination/deubiquitination processes................................. 3  
   1.4 Aims of the current study................................................. 6  

2. Publications  
   2.1 *UBXN1* polymorphism and its expression in porcine  
         *M. longissimus dorsi* are associated with water holding capacity................. 8  
   2.2 Novel SNPs of the porcine *TRIP12* are associated with water holding  
         capacity of meat................................................................. 17  
   2.3 *UBE3B* and *ZRANB1* polymorphisms and transcript abundance are  
         associated with water holding capacity of porcine *M. longissimus dorsi.* 27  

3. Discussion  
   3.1 A hypothesis to explain the role of ubiquitination pathway impacting on  
         water holding capacity of pork................................................. 35  
   3.2 The effects of functional candidate genes on the quality of pork........ 37  
      3.2.1 The analysis of *UBXN1*.................................................. 37
3.2.2 The analysis of TRIP12

3.2.3 The analysis of UBE3B

3.2.4 The analysis of ZRANB1

3.2.5 Consistent effects of the candidate genes on water holding capacity of pork

3.3 The interaction of RYRI and candidate genes related to the ubiquitination process and its effects on meat quality

3.3.1 The effects of RYRI on the meat quality traits

3.3.2 The interactions of candidate genes with RYRI affect the meat quality

3.4 Implication and Outlook

4. Summary

List of Figures

List of Tables

Bibliography

Enclosure

1. List of abbreviations

2. Acknowledgement

3. Declaration

4. List of publications and talks
